

Where the MRS Engine Stands

Clinical and research AI splits two ways. Point-of-care tools answer a physician's question fast, and often free. Research-grade platforms cost hundreds of millions to build and can surface connections no single paper states — but they aim at the drug pipeline, not the exam room. The MRS Engine brings that research-grade depth to the individual patient, at the point of care.

READING THE FIELD

■ Point-of-care lookup

Fast answers to the question asked. Everywhere, often free — and blind to what a question can't capture. (OpenEvidence, UpToDate, EHR alerts.)

■ Research-grade discovery, in the lab

Knowledge-graph and generative platforms that surface non-obvious connections — built for hundreds of millions to ~\$1.8B, aimed at the drug pipeline. (BenevolentAI, Insilico, Recursion.)

■ Research-grade discovery, at the point of care

The same depth, brought to the physician's individual patient. One occupant: the MRS Engine.

The only instrument that brings research-grade depth to the individual patient — at the point of care.

Company positioning reflects publicly reported focus as of July 2026 and is subject to change; the drug-discovery platforms operate wet-lab and clinical pipelines the MRS Engine does not. The MRS Engine is a clinical decision-support instrument for complex, multi-comorbidity cases — it surfaces research-supported evidence to inform physician judgment, and does not diagnose or replace clinical decision-making.

Inside the Instrument

Page one showed where the MRS Engine stands. This is what sits behind that position — the capabilities and amenities that make it a professional-grade instrument rather than a lookup tool.

- Live in production
- On the roadmap

THE ENGINE <i>the core research instrument</i>	LIVE INTELLIGENCE <i>the instrument watches itself</i>	SECURITY & TRUST <i>built for diligence</i>	THE EXPERIENCE <i>amenities for the practice</i>
• Seven-stage research pipeline — whole case in, documented result out • 13 live medical research sources (PubMed, trials registries, Europe PMC, bioRxiv & more) • Every finding traces to a real, resolvable source — independently audited • Built for complex, multi-comorbidity cases • Two physician-ready PDFs delivered to the inbox, per case • JELLO classification: bio-depth × cross-domain source • The RMS Button — a Reasonable Man Standard judgment gate on every result	• Live admin dashboard — every practice, at a glance • Per-practice usage metering: runs this month, trial clock • Append-only event stream — a permanent, auditable record • Secure Cognito login on an isolated admin boundary • SARIMON console — retention, conversion & churn signals • National situational-awareness view of engine activity	• Mandatory two-factor authentication (TOTP) • Federal NPI verification against the NPPES registry • Signed BAA required before any real-patient access • Proprietary prompts sealed in AWS Secrets Manager • PHI handling with an isolated admin boundary by design • Architected to hold 10,000+ practices at scale	• 60-day free trial — the full engine, no cost • Sandbox mode — try the whole engine with no PHI, on a guided case • Standard billing & coding disclaimer on every report • Annual plan option • FHIR-aligned intake → EHR integrations as adapter modules • Additional pre-built guided scenarios

Live capabilities are in production today; items shown in lighter grey are upcoming features, specified and in build. The MRS Engine is a clinical decision-support instrument for complex, multi-comorbidity cases — it surfaces research-supported evidence to inform physician judgment, and does not diagnose or replace clinical decision-making.
